

Managed Services

101 DATA
SOLUTIONS

Managing your data for maximum efficiency

Here at 101 Data Solutions, we provide companies with the help they need to manage their data, especially when those enterprises are not equipped to do so independently. We help our clients reduce the cost of managing their data while improving its accessibility and security.

As an intermediary between businesses and third-party providers such as Microsoft, Dell, Seagate, HPE and Spectra Logic, we offer data management, migration, storage, protection and security tailored to the specific needs of the organisation.

As trusted and reliable experts, we ensure our client's data is stored, transferred, and handled correctly, so that their critical information is not compromised, and their business can operate smoothly. Our solutions also enable businesses to scale their data management when necessary at affordable prices.

101 Data Solutions

Microsoft 365 & Azure

Microsoft 365 & Azure

When you're using Microsoft 365 and Azure in your business, it might seem like there are too many different software programs to keep track of. In addition, it's easy to confuse which services are from Microsoft and other vendors.

You may even use an outdated version of the software or an unsupported product edition. If you have a support contract with the vendor, they might help with this situation. The vendor may tell you that purchasing their new product is the best solution. 101 Data Solutions can step in and help. We have the skills to solve issues with software products and licensing.

You may not have the time to migrate your business to the updated software. At 101 Data Solutions we can help you migrate your data to a new system, e.g. Azure, and ensure that is the right migration path for you. In addition to migration, you may want to upgrade to a more modern system, so we can help you identify the software upgrades that will meet your needs.

Microsoft Azure is the most common cloud-based service for Microsoft 365. It allows you to host your software programs on Microsoft's servers.

Businesses often go to Azure so that they don't have to manage on-premise hardware or they want compute and storage on demand for the short term or long term.

New versions of Azure require specialised skills to set up and manage servers. If you don't feel you have the skills necessary to set it up securely, we can help.

Many Microsoft services are delivered through Software as a Service (SaaS). You pay the vendor a fee to access the Software. You then have the right to use it in your business if you pay the monthly payment.

Maintaining SaaS relationships can be complicated. You can make this process easier by working with us. We can help you select the best software for your needs and help you navigate the licensing issues that could arise from moving services to other vendors.

Remote Monitoring

Remote Monitoring

Remote monitoring makes it easier to monitor your systems proactively and catches problems faster. It's not uncommon for enterprises to have remote monitoring in place, but many struggle with implementing and maintaining their monitoring programs.

Remote monitoring is remotely accessing your systems and analysing their performance. Data can include network traffic, application performance, server and storage utilisation. Usually, remote monitoring is done over the internet and requires third-party software installed and configured on your systems.

Depending on the problem you're trying to solve, you can choose the type of monitoring that's best for you. We can discuss the options you have available, which include real-time monitoring (shows you the current state of your systems) and remote monitoring (gives a historical view of your systems). We will install the monitoring software on your systems and ensure it is appropriately configured.

Data Backup

Data Backup

You may have the best hardware and software in your office, but your valuable data could be lost forever without a proper backup strategy. We can help backup your data so you can be sure that your data is safe from data loss and other cyberattacks.

We are experts at providing data backup and recovery services. We use the best data protection technologies. From data encryption to data reduction, we know the best way to approach data backup and ensure your data is secure. We know how to leverage data protection technologies to ensure your backups are scheduled and completed correctly.

We can arrange to automate your data backup process. This means that you don't have to initiate your backup process manually. Instead, the data is automatically backed up at scheduled times, and the entire process is sent to online storage. You can easily track your progress, know when your data was last backed up, and be notified if there's ever a delay in the process.

Traditional data backup only protects against data loss during scheduled backup times. Your data won't be protected if a cyberattack or data corruption occurs outside those times.

Therefore, we offer cloud storage for data backup. This means your data is continuously backed up, protecting against data loss outside the scheduled backup times. You can also always store your backups in the cloud, so it's available if you ever need to restore your data.

Data management made easy

Our mission is to ensure your data is safe, secure, and available when needed. 101 Data Solutions is an award-winning data management and data security company for mid-size enterprises. Speak to one of our consultants today - we'd be happy to help!
